

Busbar Contacts For Anderson Connectors

Busbar Contacts For Anderson Connectors

The bus bar contact attaches directly to copper bus minimising system assembly, replacement or repair time.

These contacts are for use with Anderson 50A, 175A and 350A two pole battery connectors.

Contacts are made from solid copper, are silver plated and are threaded to provide simple attachment to bus bars without the need for special tooling.

The "D" shaped knurled shoulder on the contact assures a snug fit to prevent contact rotation.

The use of bus bar contacts also facilitates the use of plug-in subsystems and subsystem testing for field site service and repair.
